Peter Benoit

Senior UI Engineer · Creative Front-End Architect · Focused on Fast,
Accessible, Impactful Web Apps
Ocala, Florida, United States

Summary

I'm passionate about transforming complex design challenges into digital experiences that are not only visually stunning but also accessible to everyone. I specialize in turning sophisticated designs into intuitive, high-performance solutions that work for all users, with a focus on rock-solid technical implementation.

I've had the privilege of working on platforms like CDC.gov, Coke.com, Harley-Davidson.com, and AutoTrader.com, where I've honed my ability to create beautiful, scalable websites and applications. What drives me is ensuring great designs become great experiences by bridging the gap between UX and development without compromise.

Toolkit:

- Frontend: Expertise in React/Next.js, with experience in Angular, Vue, and Svelte
- JavaScript: From vanilla JS to frameworks like jQuery and Knockout.js
- Build & Development: Webpack, Gulp, Node, Deno, npm
- Styling: Advanced CSS, including Bootstrap, Tailwind, and Bulma
- Backend: Node.js, .NET (C#, VB), PHP, ColdFusion
- Workflow: Jenkins, GitHub Actions, JIRA, SharePoint

Specialization:

- Seamlessly integrating accessibility into every step of development using tools like aXe, ANDI, and WebAIM
- Developing custom solutions, from CMS platforms and inventory systems to payment processing applications
- Building engaging mobile and Smart TV applications
- Collaborating with UX teams through Figma, Axure, and Adobe Creative Suite
- Leading teams by setting standards, training developers, and conducting thoughtful code reviews

I excel at seeing projects through from concept to completion, with a focus on creating accessible, high-performance solutions. Years of working across departments have given me a unique ability to translate between design and development, ensuring every project delivers on its vision.

Experience

Peraton

Senior User Interface Engineer / Front-End Developer

October 2008 - October 2024 (16 years 1 month)

Atlanta, Georgia, United States

As a Senior UI Engineer at CDC, I spent my time building and improving the front-end architecture that powers CDC.gov's massive web presence. Working across multiple frameworks - from working on PHP applications to developing new features in Angular, React, and Vue. My largest contribution was creating the CDC.gov Template Package, which standardized how all CDC websites look and feel using Bootstrap and custom JavaScript. It earned notable awards, and helped billions of visitors efficiently access critical health information.

During the COVID response, I engineered real-time dashboards using D3.js that helped millions track the pandemic. We maintained rapid development cycles, often pushing new features within 24 hours while ensuring our visualizations could handle massive data loads without performance issues.

I developed a shared component library that enables code reuse across different projects, significantly reducing development time while maintaining consistency. My focus on developer experience led to creating custom build tools and implementing a robust CI/CD pipeline that caught accessibility and UX issues early. Everything we built adhered to WCAG 2.1 and Section 508 standards - essential for ensuring universal access to public health information.

Beyond development, I worked closely with UX designers to translate complex wireframes into responsive, interactive interfaces. From optimizing front-end performance to solving cross-browser compatibility challenges to creating

intuitive data visualizations, the work involved tackling complex technical problems while keeping the end-user experience at the forefront.

AutoTrader.com

Innovation Architect

October 2011 - October 2012 (1 year 1 month)

At AutoTrader.com, I collaborated with the Product Innovation team to develop mobile and Smart TV applications that expanded platform reach by over 1 million users and enhanced engagement through innovative technology.

- Developed Cross-Platform Android App: Built AutoTrader's Android app using Apache Cordova, JavaScript, and CSS, enabling 500,000+ users to browse listings, search vehicles, and access personalized content on mobile.

Partnered with the iOS team to ensure UI consistency, improving cross-platform user satisfaction and engagement.

- Expanded Reach via Samsung Smart TV Integration: Designed and deployed AutoTrader's first Smart TV app, integrating video content from YouTube to reach an additional 100,000+ Smart TV users. Leveraged the Samsung Smart TV SDK, JavaScript, and jQuery to create an intuitive, remote-compatible interface, boosting brand exposure on an emerging platform.

- Improved Video Accessibility and Usability: Implemented a custom video filtering system for Smart TV that improved video discoverability by 80%, contributing to a higher user retention rate on the app.

Core Skills: Mobile App Development (Apache Cordova, JavaScript, CSS, HTML5), Cross-Platform Consistency, Video Content Integration (Samsung Smart TV SDK), User Experience Design, Performance Optimization

NeboWeb

Senior Web Developer

2007 - 2008 (1 year)

During my time at Neboweb, I was responsible for leading the conversion of existing PHP applications and Content Management Systems (CMS) into ASP.NET, helping the organization transition to a more scalable and robust platform. This involved not only code migration but also re-architecting certain parts of the applications to ensure they aligned with ASP.NET's framework, providing long-term flexibility and performance improvements. I worked closely with the development team to ensure that the transition was smooth, with minimal disruption to the existing applications.

In addition to leading technical conversions, I mentored junior developers on coding practices, ensuring they understood both PHP and ASP.NET frameworks, and guiding them in adopting industry best practices. This mentorship contributed to the team's overall growth and helped junior developers improve their skills in full-stack development.

A significant part of my role involved converting PDFs and wireframes into HTML/CSS prototypes, turning static designs into functional web interfaces. I collaborated with project managers to provide accurate estimates and timelines for development tasks, ensuring that both technical and business requirements were aligned.

I also developed new websites using a custom PHP framework integrated with MySQL and jQuery, tailoring the backend and front-end components to meet specific project needs. This work involved building dynamic, interactive websites that catered to client specifications, while ensuring efficient database integration and smooth user experiences.

Wiretree

Senior Web & Application Developer

2006 - 2007 (1 year)

Atlanta, Georgia, United States

At Wiretree, I worked as a full-stack developer, building and maintaining web applications using ASP.NET and MS SQL for the backend, while also creating front-end interfaces with HTML, JavaScript, CSS, and jQuery. I was responsible for both server-side logic and designing user-friendly interfaces, ensuring seamless integration between the back-end functionality and front-end design. My work often involved translating complex business requirements into scalable and efficient web applications that met the needs of both the clients and end users.

Though my main focus was development, I also took on quality assurance tasks, conducting informal code reviews and ensuring that the code met high standards before deployment. I stepped in to support the team by troubleshooting issues and maintaining code quality, even though this wasn't an official part of my role.

In addition to development, I collaborated with the design and Flash development teams, offering technical support and solutions for complex issues. This cross-functional collaboration helped streamline the development

process and ensured that all components of our projects—from multimedia elements to core functionality—were aligned. I also contributed to project documentation and assisted management in resource allocation and defining project workflows, helping to keep projects on track and aligned with business goals.

Silver Moon Concepts, LLC
Senior Web Programmer
2003 - 2006 (3 years)

At Silver Moon Concepts, I was responsible for designing and developing a robust web platform using ColdFusion and SQL Server to handle the company's online sales. The website I developed not only streamlined the company's e-commerce operations but also significantly boosted revenue—surpassing the combined sales of all the company's sales personnel. This project involved integrating the shopping cart functionality across multiple customer websites using ASP, ColdFusion, and SQL Server, ensuring a seamless and efficient user experience for all customers.

One of the key integrations I developed was with ConnectShip, using XML to link the website with real-time shipping services. This provided customers with accurate shipping charges and tracking information directly on the platform, enhancing the overall service quality and improving order transparency.

In addition to e-commerce functionality, I designed and implemented a web-based email promotion system, which included both the content and layout for promotional campaigns. This system allowed the company to create and send targeted marketing campaigns, increasing customer engagement and driving more traffic to the website.

Another critical project I led was the development of a supply chain management system. This system allowed vendors to check inventory levels and submit new order requests for approval by management. It improved efficiency by automating the supply chain process, reducing manual tasks, and ensuring accurate inventory tracking.

I also managed the migration of the company's database from Paradox to SQL Server using data transformation services, ensuring the company's data infrastructure could handle future growth. This migration provided a more stable, scalable database solution, enabling more complex operations and reporting capabilities for the business.

The Marlin Group
Full Stack Developer
2001 - 2003 (2 years)
Kissimmee, Florida

At Marlin ESourcing Solutions, I played a key role in developing EDGE, a web-based application built using ColdFusion and Oracle. This platform enabled businesses to outsource product sales online, providing a scalable solution for managing e-commerce operations. The application streamlined processes such as inventory management, order processing, and customer interaction, allowing businesses to focus on their products while EDGE handled sales, billing, and fulfillment logistics.

I managed critical e-commerce functions for 30+ companies, overseeing inventory, shopping carts, payments, and shipping using JSP, VeriSign for secure payments, ConnectShip via XML, and Oracle for database management.

I also developed a CRM front-end for EDGE, enabling call centers to process orders for multiple companies. This integration simplified order management, allowing representatives to handle inquiries and sales across clients through a unified interface.

Additionally, I designed an inventory and warehouse management system that tracked stock levels, analyzed sales trends, and measured promotion effectiveness. This provided businesses with deeper insights and helped optimize inventory processes, reducing excess stock and improving efficiency.

Beyond e-commerce, I developed a PHP and Sybase-based alarm monitoring system for home and business security, allowing real-time tracking and response to alarms. I also led the development of a distance learning and presentation platform, which distributed content across multiple locations in real time, enabling live interaction and automatically archiving presentations for future access.

Triton Network Systems
Web Developer
1997 - 2001 (4 years)

At Triton Network Systems, I was responsible for designing and developing the company's corporate internet site from the ground up. Using a combination of HTML, DHTML, CSS, ColdFusion, JavaScript, Flash, and Photoshop, I

created a dynamic and visually appealing website that effectively represented the company's brand. My work included not only the technical aspects of development but also the design, layout, and formatting to ensure a professional and engaging user experience. Additionally, I integrated Microsoft Agent to provide interactive content, enhancing user engagement on the site.

I also developed the company's corporate intranet using ASP, which served as a centralized hub for internal communication and company information. The intranet featured customized security profiles that determined the content and product information each user could access, ensuring sensitive data was protected and only available to authorized personnel.

To make the intranet user-friendly and accessible to non-technical teams, I designed a content management system (CMS) that allowed various departments to easily create and maintain their own content without requiring web programming knowledge. This CMS streamlined internal processes and empowered different groups within the company to manage their sections of the site independently, reducing bottlenecks and improving efficiency.
